Project Title: Water Pollution

No. of Participants: 5

Report of project work:

The students of the **B.Sc. Programme 3rd semester** did a project work entitled '**Water Pollution**' as a part of their **SEC Chemistry Internal**. Most of them have done their **projects in Bengali which is their medium of instruction**. Studying and growing up in a place which is embanked on the sides of River Jalangi, students need to realize the need for preventing water pollution. In order to prevent pollution, first they need to identify the sources of pollution and what are the effects. They realize that some of their day to day activities such as throwing garbage in water bodies can cause pollution. These students can further spread their knowledge in their family or their neighbors. They also learn ways to clean polluted water bodies. This project aims at creating a sense of environmental values in the minds of the young students.

Project Title: Renewable Energy

No. of Participants: 34

Report of project work:

The students of the **B.A. and B.Sc. Programme 2nd semester** did a project work entitled '**Renewable Energy**' as a part of their **Environmental Education**. Most of them have done their **projects in Bengali which is their medium of instruction**. Students are encouraged to start practicing the use of renewable energy resources over the non-renewable ones. The projects highlights the different types of available renewable resources such as solar energy, wind energy, biomass, tidal, hydro energy etc. The students belong to rural areas where small solar panels or biogas plants could be set up. These ideas are introduced to the students through this project work.

Project Title: Biological Hazards

No. of Participants: 89

Report of project work:

The students of the **1st Semester Honors** did a project work entitled '**Biological Hazards**' as a part of their **Environmental Education** subject. Most of them have done their **projects in Bengali which is their medium of instruction**. A biological substance or, organism that can affect the health of healthy living organisms is a potential biohazard. This was a very relevant topic especially after the corona pandemic. There are several levels of biohazards from 1-4 depending on the impact. The corona virus comes under level 3. The American National Standard Institute has established specific labels for bio-hazardous substances. They are also classified for transportation by UN number. Most medical wastes are identified as biologically harmful. It is important to identify and properly dispose such wastes. Students gained an important knowledge on the sources and effects of these substances through this project work.
